## WHAT IS CLAIMED IS:

1. For use in a wireless network comprising a plurality of base transceiver stations, each of said base transceiver stations capable of establishing and maintaining communication links with a plurality of a mobile stations by means of at least one overhead channel and a plurality of data traffic channels, an apparatus for allocating said plurality of data traffic channels comprising:

at least one of:

a failure detection circuit capable of detecting a failure in said at least one overhead channel of a first base transceiver station and generating a failure notification; and

an access request detection circuit capable of detecting an access request message received from an accessing one of said plurality of mobile stations and generating an access request notification; and

a channel allocator capable of receiving at least one of said failure notification and said access request notification and, in response thereto, terminating a first communication link between said first base transceiver station and a first selected one of said plurality of mobile stations, wherein said first selected mobile station maintains at least a second communication link with

| 22 at | least a second base transceiver station, and at least one of: |
|-------|---|
| 23    | reconfiguring a first data traffic channel                    |
| 24    | associated with said terminated first communication link      |
| 25    | as a replacement overhead channel replacing said failed       |
| 26    | overhead channel; and   |
| 27    | allocating said first data traffic channel                    |
| 28    | associated with said terminated first communication link      |
| 29    | to establish a communication link with said accessing         |

mobile station.

2. The apparatus set forth in Claim 1 wherein said channel allocator is capable of determining if one of said plurality of data traffic channels associated with said first base transceiver station is unused prior to terminating said first communication link between said first base transceiver station and said first selected mobile station.

- 3. The apparatus set forth in Claim 2 wherein said channel allocator reconfigures an unused one of said plurality of data traffic channels associated with said first base transceiver station as said replacement overhead channel in lieu of terminating said first communication link and reconfiguring said first data traffic channel associated with said terminated first communication link.
- 4. The apparatus set forth in Claim 2 wherein said channel allocator allocates an unused one of said plurality of data traffic channels associated with said first base transceiver station to establish a communication link with said accessing mobile station in lieu of terminating said first communication link and allocating said first data traffic channel associated with said terminated first communication link to establish a communication link with said accessing mobile station.

- The apparatus set forth in Claim 1 further comprising a 1 memory coupled to said channel allocator, wherein said memory is 2 capable of storing status data associated with said first communication link.
- The apparatus set forth in Claim 5 wherein said status 1 data comprises a received signal strength indicator associated with 2 said first communication link. 3
  - The apparatus set forth in Claim 5 wherein said status 7. data comprises handoff state data, wherein said handoff state data indicates whether said first selected mobile station associated with said first communication link maintains said at least a second communication link with said at least a second base transceiver station.
  - The apparatus set forth in Claim 7 wherein said handoff state data indicates a total number of communication links said first selected mobile station maintains with other ones of said plurality of base transceiver stations.

| .9. | A   | wireless | network | comprising: |
|-----|-----|----------|---------|-------------|
|     | 4.5 | 11,22020 |         | J           |

a plurality of base transceiver stations, each of said base transceiver stations capable of establishing and maintaining communication links with a plurality of a mobile stations by means of at least one overhead channel and a plurality of data traffic channels; and

at least one apparatus for allocating said plurality of data traffic channels comprising:

## at least one of:

a failure detection circuit capable of detecting a failure in said at least one overhead channel of a first base transceiver station and generating a failure notification; and

an access request detection circuit capable of detecting an access request message received from an accessing one of said plurality of mobile stations and generating an access request notification; and

a channel allocator capable of receiving at least one of said failure notification and said access request notification and, in response thereto, terminating a first communication link between said first base transceiver station and a first selected one of said

plurality of mobile stations, wherein said first selected mobile station maintains at least a second communication link with at least a second base transceiver station, and at least one of:

reconfiguring a first data traffic channel associated with said terminated first communication link as a replacement overhead channel replacing said failed overhead channel; and

allocating said first data traffic channel associated with said terminated first communication link to establish a communication link with said accessing mobile station.

10. The wireless network set forth in Claim 9 wherein said channel allocator is capable of determining if one of said plurality of data traffic channels associated with said first base transceiver station is unused prior to terminating said first communication link between said first base transceiver station and said first selected mobile station.

- 11. The wireless network set forth in Claim 10 wherein said channel allocator reconfigures an unused one of said plurality of data traffic channels associated with said first base transceiver station as said replacement overhead channel in lieu of terminating said first communication link and reconfiguring said first data traffic channel associated with said terminated first communication link.
- 12. The apparatus set forth in Claim 10 wherein said channel allocator allocates an unused one of said plurality of data traffic channels associated with said first base transceiver station to establish a communication link with said accessing mobile station in lieu of terminating said first communication link and allocating said first data traffic channel associated with said terminated first communication link to establish a communication link with said accessing mobile station.
- 13. The wireless network set forth in Claim 9 wherein said apparatus further comprises a memory coupled to said overhead channel controller, wherein said memory is capable of storing status data associated with said first communication link.

.12

17. For use in a wireless network comprising a plurality of base transceiver stations, each of the base transceiver stations capable of establishing and maintaining communication links with a plurality of a mobile stations by means of at least one overhead channel and a plurality of data traffic channels, a method for allocating the plurality of data traffic channels comprising the steps of:

at least one of:

detecting a failure in the at least one overhead channel of a first base transceiver station;

detecting an access request message received from an accessing one of said plurality of mobile stations; and in response to at least one of the failure detection and the access request message detection, terminating a first communication link between the first base transceiver station and a first selected one of the plurality of mobile stations, wherein the first selected mobile station maintains at least a second communication link with at least a second base transceiver station; and

at least one of:

reconfiguring a first data traffic channel associated with the terminated first communication link

as a replacement overhead channel replacing the failed overhead channel; and

allocating the first data traffic channel associated with the terminated first communication link to establish a communication link with the accessing mobile station..

- 18. The method set forth in Claim 17 further comprising the step of determining if one of the plurality of data traffic channels associated with the first base transceiver station is unused prior to terminating the first communication link between the first base transceiver station and the first selected mobile station.
- 19. The method set forth in Claim 18 further comprising the step of reconfiguring an unused one of the plurality of data traffic channels associated with the first base transceiver station as the replacement overhead channel in lieu of terminating the first communication link and reconfiguring the first data traffic channel associated with the terminated first communication link.

2

4

5

6

20. The method set forth in Claim 16 further comprising the step of allocating an unused one of the plurality of data traffic channels associated with the first base transceiver station to establish a communication link with the accessing mobile station in lieu of terminating the first communication link and allocating the first data traffic channel associated with the terminated first communication link to establish a communication link with the accessing mobile station.
